Preface

The compilation of agricultural statistics contained in this publication is in response to the needs of those who are interested and involved in agricultural activities on Guam. Farmers and prospective investors often ask for information about Guam production, imports and prices of produce. Administrators, planners and policy makers in various public agencies frequently inquire about agricultural statistics for planning and policy formulation purposes. Researchers in various agricultural fields are frustrated by the lack of basic agricultural data needed for writing proposals for grants and conducting research. This is especially true when reliable time series data are needed for making projections.

This publication is by no means comprehensive but it is hoped that the dissemination of information contained herein will assist many people who are involved in and concerned with agricultural development on Guam. Since statistical data provide an important basis for decision making and evaluating agricultural activities over a period of time, their availability should lead to better planning, improved decision making processes, and effective policy formulation.

However, the statistical information presented must be used very carefully. For example, Tables 18 and 23 show that while the population on Guam in 1977 was 99,600, there were 26,052 and 90,634 regular and emergency Food Stamp recipients in 1976, a total of 116,686. In Table 39, per acre yield of Chinese cabbage increased from 5.75 tons in 1978 to 121 tons in 1979. It is doubtful that Guam farmers sold \$425,000 worth of produce to the military outlets in 1979 as reported in Table 50. Therefore, users of this publication are advised to use discretion.
